How Eminent Domain Can Save our Cities

By David H. Katz
July 29, 2012
(Revision of Memo Dated December 18, 2007)

Recent headline news in the U.S. has centered on the novel use of eminent domain as a possible solution to the current housing crisis. One solution that seems to be receiving the most public attention is a proposal advanced by Steven Gluckstern of Mortgage Resolution Partners ("MRP"). MRP’s principals have been advanced a unique proposal to assist the City of San Bernardino, California in solving its current housing crisis. MRP’s proposal involves municipal condemnation of "mortgages" on residential real estate through the exercise of eminent domain. MRP wants San Bernardino to condemn mortgages, force the holder of the loan to accept the net proceeds on the basis of the property’s current appraised value and subsequently refinance the "condemned mortgage" through MRP.

Since 2007, residential housing values have been spiraling downward. While the dramatic decline in housing prices could have been averted, the "eminent domain solution" is attracting serious attention for the first time in US history. Every novel solution has its detractors and any proposal to using eminent domain as a public policy tool is and will be controversial. Due to the sheer volume and magnitude of the housing crisis, every rescue plan will be complicated and costly. However, there is an eminent domain structured solution that, while requiring coordinated policy objectives among the cities, states and federal government, is built upon existing precedent and can and should be considered in evaluating a comprehensive solution to our nation’s housing woes.

What is Eminent Domain?

Eminent Domain in an action of a local, state or federal government to seize a citizen’s real or personal private property, or seize a citizen’s rights in property with due monetary compensation, but without the owner’s consent. The property is taken either for governmental use or by delegation to third parties who will devote it to public or civic use or, in some cases, economic development.

The Constitution’s Fifth Amendment imposes limitations on the exercise of eminent domain: the taking must be for “public use” and "just compensation" must be paid. Under the terms of the U.S. Constitution, the government is legally entitled to appropriate a private citizens’ property provided the private citizen is justly compensated. The exercise of eminent domain by a governmental agency is commonly referred to as “condemnation”. The US Supreme Court has addressed the issue of what constitutes a "public use" on many occasions without stirring too much controversy. However, in 2005 the Supreme Court expanded the scope of the "Public Use Doctrine" to include purposes that many argue were never intended.
In *Kelo v. City of New London*, 545 U.S. 469 (2005) the Court affirmed the authority of New London, Connecticut, to take non-blighted private property by eminent domain, and then transfer it for a dollar a year to a private developer solely for the purpose of increasing municipal revenues. This 5-4 decision received heavy press coverage and inspired a public outcry that eminent domain powers were too broad. In reaction to *Kelo*, several states enacted or are considering state legislation that would further define and restrict the power of eminent domain.

**Why Use Eminent Domain Now?**

One can only speculate whether the Supreme Court’s ruling in the *Kelo* case contemplated such an expansive application of the “Public Use Doctrine” in *Kelo* would serve as the foundation for applying the doctrine of eminent domain to save our cities. Even if they didn’t anticipate this novel approach to condemnation, the law of unintended consequences should work in favor of a national solution this time. In order to understand why eminent domain is the best solution, it would be best to provide the historical context that led us to the quagmire in which we find ourselves today.

At the height of the housing “bubble” in 2006 a number of “private label securities” and exotic, new private label derivative securities (like “collateralized loan obligations” and “collateralized debt obligations”) were being issued by Wall Street investment banking firms and sold around the world to institutional investors such as banks, insurance companies, sovereign wealth funds and hedge funds. These instruments bundled mortgages and/or mortgage-backed securities (MBS) into securities themselves. These derivative securities were selling the cash flows from the principal and interest payments received on mortgages that were paid to the holders of the MBS who, in turn, pooled the MBS themselves and sold the MBS cash flows to the institutional investor.

Bundling these cash flows was extremely profitable for everyone involved. The institutional investors were buying these securities as fast as Wall Street could issue them. Everyone was making a lot of money as long as housing prices continued to rise. Every time a home were sold or refinanced, the mortgage would be paid off and the investors of the MBS would be repaid.

The problem is that no one ever thought housing values would decline and the rating agencies thought the best solution for hedging a foreclosure or default risk was to “over-collateralize” the pools of loans. In other words, in order to issue $100 Million in MBS, the issuer (like Goldman Sachs, Bear Stearns or Lehman Brothers) had to deposit $115 Million in mortgages in the pool. Therefore, if 7% of an MBS pool defaulted, the investor shouldn’t suffer a loss because they had collateralized the pool with 15% more than the actual issuance creating a “buffer” to absorb the losses. Sounds like a plan, right?
The Other Shoe Drops

It was a good plan as long as housing prices continued to rise. However in order to meet the rising demand from institutional investors, Fannie Mae, Freddie Mac and the rest of the Wall Street MBS issuers started including mortgage loans with questionable (and ultimately no) underwriting guidelines.

The script went something like this:

No credit - no problem. Bad credit - no problem. Don't make enough money for the loan you're requesting? Non-problem, we'll just provide you with a "teaser rate" adjustable rate mortgage (ARM) your payment will be low and affordable for the next 3 years. By the time the interest rate on your loan is ready to re-set, property values will be higher and we'll refinance you again.

So what happened in 2007? Property values stopped increasing, the interest rate on these "teaser-rate" ARMs re-set and a number of these derivatives were so exotic no one knew who owned the actual underlying mortgage. Why was this important? Because in a number of states, in order to commence a judicial foreclosure action, the lender has to prove it owns the loan and therefore has the right to foreclose on the mortgage. Well... who owns the mortgage?

That's an interesting legal question. Quite often the original lender sold the loan or transferred it to a Trustee who held the loan “in trust” for the benefit of the securities holders who bought MBS. Normally, when an MBS is created, they execute a tri-party agreement called a “Pooling and Servicing Agreement” (PSA). The parties to the PSA are (1) the Servicer, who collects payments of principal, interest, taxes and insurance from the homeowner each month and (a) deposits the taxes and insurance into a separate escrow account to pay the taxes and insurance premiums when they become due and (b) remits the principal and interest payment to the Trustee; (2) the Trustee who receives payments of principal and interest from the Servicer and remits the payments to the owner of the MBS when they are due; and (3) the Investor who pays for the MBS and receives principal and interest from the Trustee as the return on its investment.

The PSA is a very long document which contains very detailed, strict instructions on the scope of authority and discretion the Servicer and Trustee have in its dealing with the homeowner. These detailed instructions are designed to leave little or no discretion on the part of the Servicer or Trustee in how to deal with the homeowner defaults, foreclosures, bankruptcies, loan modifications and how to dispose of foreclosed property. While this may sound harsh, it is actually intended to benefit everyone involved. If the Servicer follows the PSA instructions, the Servicer is insulated from liability from the investor. The Trustee is also shielded from
liability as long as it follows the instructions from the investor and the investor is comforted with the knowledge that a process is in place to protect its investment.

So far so good, right? Yep. But who owns the loan? In many states the Courts require proof of ownership to commence a foreclosure action. In 2008-2009, this became a serious problem. Servicers commenced foreclosure proceedings in many state courts only to be told that if they couldn't prove ownership of the loan, they were unable to use the courts to commence a foreclose.

To compound the problem, the exotic derivatives didn't consist of pools of mortgages, where you might be able to prove that a trust owned the loan. The exotic derivatives were pools of MBS, not mortgages. So now the answer to “who owns the mortgage” has gone from bad to worse because the derivatives securities only represented an ownership interest in the cash flows coming from the MBS and the MBS cash flows were coming from the pooled mortgages. So the question the courts were asking is “Who owns the loan? If you can’t prove who owns the loan, who’s in charge of advising the servicer on how to handle the foreclosure?”

Foreclosures were in a holding pattern until someone could figure out a solution.

The MERS Problem

Another major contributing factor creating confusion about loan ownership is the mortgage industry’s adoption and utilization of the Mortgage Electronic Recording System (MERS) to assign and transfer ownership of mortgage loans. Under the MERS system, a lender assigns the loan to MERS and MERS would be the “gatekeeper” as to who owned the mortgage loan by reflecting transfers of ownership on its books rather than recording mortgage assignments. MERS was not the owner of the mortgage; it is merely the record keeper using a “book entry” system to evidence transfers of mortgage loans. In theory it is a great idea because it eliminates the need to deliver the physical assignments to the buyer every time a transfer occurs. It creates efficiency and allows for liquidity in trading mortgages.

However, in the world of mortgages, ownership transfers the seller to deliver and/or record an Assignment of Mortgage and have the seller endorse the promissory note to the buyer. Without recording the assignment in the local county recorder’s office, as required by most state laws, there’s no way to tell who owns the mortgage loan and therefore who’s entitled to commence a foreclosure.

“Book entry” transfers of mortgage loans are not (or shouldn’t be) a practical solution because the system actually hides the name of the actual owner of the mortgage. While it was created to serve a dual purpose, i.e., to create liquidity and speed in trading mortgages, and avoid paying any fees and /or taxes in connection with recording the assignment, it also created a nightmare in determining ownership of the mortgage loan. For example, when a loan is sold and the registered ownership is only reflected utilizing the book entry method, the MERS
system undermines the purpose of the recording statutes which is to put everyone on notice about a claimed lien so a third party can contact them owner if necessary.

This is a very important component to the land registration and transfer system. It provides third party prospective lenders, junior lien holders, attorneys, buyers and title companies with vital information about who to contact for information about the lien. Why? Among the many reasons, second mortgage lenders need to know information about the status, the outstanding principal balance, the escrows for taxes and insurance being collected by the first mortgagee and other vital information which they need to know before lending money to a prospective borrower. MERS substantially limited access to the information for which the recording statutes were enacted; to make this public information. Who owns the loan when MERS is the “holder of record”? Good question. And that’s what the courts thought as well.

Pouring Salt into the Wound

During the “go-go” days of the MBS and private label securities, mortgage lenders and banks were overwhelmed with loan demand and didn’t have adequate personnel to handle the volume of loan demand. So instead of slowing down the process greed took over. Wall Street’s demands for more product pushed loan servicers and banks into satisfying loan demand by engaging in unorthodox behavior (to put it mildly). The loan originators, mortgage banks and banks hired people to forge the signatures of authorized loan officers on mortgage assignments so the MBS could be issued quickly to meet the ever increasing investor appetite for MBS. No one would have known the scope of the “robo signing” fraud as long as home prices continued to increase. Foreclosures were a remote possibility but in market of ever increasing property values, refinancing was a more likely scenario and no one would be the wiser once the loan was paid off.

Other Factors Preventing a Recovery

If things weren’t bad enough, here are a few additional problems exacerbating the problem to a new, unprecedented level.

a. The sheer volume of loan modification requests is so high there aren’t enough hours in the day to timely and promptly respond to borrower requests for relief. As a result of this backlog lenders and servicers are continuing the foreclosure processes in order to get to the next emergency.

b. As a result of this overwhelming volume, the courts are backlogged for months, and in some cases years, with foreclosure filings. In the interim, borrowers are refusing to make payments on the theory that since no one is paying attention to them on their loan modification
request, they won’t make a payment until someone takes the time to speak with them.

c. When a lender/servicer finally reaches out to the borrower and they have a conversation, the investor/owner of the loan (if you can determine who owns the loan) generally refuses to consider a loan modification request because they haven’t been paid in months/years on their delinquent loan.

d. When all else fails and the borrower is on the eve of foreclosure, they frequently file bankruptcy to delay the process causing an unprecedented backlog in the bankruptcy courts.

e. Between the multitude of confusing, ambiguous and sometimes-contradictory government loan modification programs, such as HAMP, TARP and others, there’s been no clear guidance for creating a uniform solution to dealing with the loan modification programs.

So Why is Eminent Domain a Solution?

In 2007, as the residential mortgage market was crumbling, primary factors attributed to the downfall included (a) mortgage origination fraud, (b) failure to underwrite the loans in a prudent, historically consistent manner, (c) the inability to prove ownership the delinquent loan, and (d) the lack of direction to the Servicer and Trustee on what to do about delinquent loans. The factors causing the mortgage mess could only be resolved if there was a solution that could be found in an existing document.

At one time Congress was contemplating legislating a forced change to existing PSAs to clear up the foreclosure backlog; however, they ultimately backed off because a Congressional mandate to amend the PSA clearly violated the U.S. Constitution’s “impairment of contract” prohibition. So....now what?

The solution seemed obvious. Eminent Domain. Here’s why:

1. Every mortgage loan document contains provisions under which the holder of the loan is required to accept an early payoff of the mortgage balance. The 3 that come to mind are:

   a. Casualty Loss. This means that if a house is destroyed by fire, earthquake or a covered natural disaster, the insurance proceeds are to be paid directly to the mortgagee (the holder of the loan) to pay off the loan and the excess, if any, goes to the homeowner. This isn’t a real good option unless we want to burn down homes for the insurance (which, of course, isn’t covered under homeowner’s policies).
b. Condemnation. This means that if a Municipality, State or the Federal Government (or any federally authorized agency) condemns property, in whole or in part, the proceeds are first used to pay off the lender and the balance, if any, goes to the homeowner.

c. Force Majeure. These involve governmental takings of property in case of war (which really could be a subset of (b) above but isn’t).

2. If these provisions are in every mortgage that’s written in the United States, then every MBS has to contain “risk disclosure provisions” that contemplate the possibility of a forced payoff (or prepayment) in each of these circumstances.

3. If they were contemplated and disclosed as a “risk factor” in the PSA because they were a part of every mortgage in the U.S., then no MBS investor can argue that it violates the PSA or Constitutional prohibition of impairing private consensual contract rights.

4. Of the 3 alternatives in Paragraph 1 above which is the least harmful to the homeowner, the city, the state, the federal government and the investor?

The answer: Eminent Domain.

OK Genius, if this is such a great plan, who the heck is going to condemn these properties and where are they going to get the money to pay for all these homes they want them to condemn? In other words, what’s the plan?

Here’s it is, step by step.

1. Whose homes should be condemned?

   **ANSWER:** Anyone whose home is “underwater” by more than 20% and are delinquent on their mortgage payments, i.e., any property with a current LTV and/or CLTV greater than 120%.

   **WHY:**

   **REASON 1.** In the early 1980s, when the U.S. was suffering from “hyperinflation”, the 30 year fixed rate mortgage was 17% and no one could qualify or afford a home loan. At that time, Fannie Mae came up with a program that permitted a borrower to make mortgage payments that weren’t enough to cover the interest portion of the loan each month, and the shortfall in interest would be added to the unpaid principal balance of the
loan until you reached a maximum of 125% of the original principal balance. This is called “negative amortization”. When a mortgage reached the 125% cap, the loan payments were required to be restructured to cover the regular principal and interest payment on the loan for the remaining term so that no new negative amortization would be allowed.

For example if a 30 year loan for a $100,000 had an interest rate of 15%, the borrower may make a mortgage payment based on the same loan but at a 9% interest rate. If the shortfall, when added to the original loan balance, ever reached a total of $125,000 (say, in year 4), the payments would be modified to pay back the new loan amount of $125,000 over 26 years (30 years minus the 4 years that elapsed) at 15%. This allowed people to buy homes when interest rates were unusually high and assisted in jump-starting the economic recovery in the hope that rates would gradually decrease and home prices would rise.

**REASON 2.** By applying an objective standard such as LTV, every affected homeowner would be treated fairly.

2. Who is going to condemn all these homes?

**ANSWER:** The Municipalities, not the State or Federal Government.

**WHY:** The cities have the greatest amount to lose by having vacant homes, i.e., blight, increased crime, impact on valuation of the remaining occupied homes and most of all, they are closest to the problem and therefore more competent to quickly implement the solution.

3. Where is all that money going to come from?

**ANSWER:** State issued residential housing bonds. The States are going to lend the money to the municipalities to fund their purchases.

**WHY:** Because legislative authority already exists to permit States to issue residential mortgage revenue bonds so we are not re-inventing the wheel.

4. Why would anyone buy State issued residential housing bonds?

**ANSWER:** Because the proposal contemplates having the U.S. Treasury issue a “guarantee” to each State-issued residential mortgage revenue bonds, essentially creating a “federally insured, federal and state income tax exempt” bond.

**WHY:** Not all states have the same credit ratings and in some cases the cost of borrowing and issuing residential housing bonds may make it unaffordable for that state to offer this kind of rescue program.
5. Why would the Federal Government guarantee State issued residential mortgage revenue bonds?

**ANSWER:** Because they're going to be compensated for issuing the guarantees (50 basis points) to be paid from the revenue received from tenants (see below for further explanation)

**WHY:** It's a lot cheaper to guarantee the loans than to bail out the banks especially when the U.S. Treasury is receiving revenue for its guarantee. It's not like these programs don't already exist. Freddie Mac and Ginnie Mae were founded on these principles.

6. So what's the actual plan? What happens to the house once the Municipality has condemned it?

**ANSWER:** The Municipality would enter into a 5-year lease with the existing homeowner (now a tenant). The lease would contain an option for the tenant to repurchase the home from the Municipality any time during the 5-year lease period at a price equal to its then current appraised value, but at no less than the price the city paid for it at the time it condemned the property. The monthly lease payment would be equal to the sum of:

a. 1/12 of the monthly principal and interest if the price paid by the Municipality were financed at an interest rate 200 bps. higher than the current market rate and based on a 40 year amortization (as opposed to a 30 year amortization) PLUS

b. 1/12 of what the property taxes would be if the house weren't owned by the Municipality (since cities don't receive property tax revenue on city-owned property) PLUS

c. 1/12 of what it would cost to insure the property against fire and casualty if the property were privately owned.

**WHY:** This would immediately enable the property to remain occupied, decrease the incidence of vandalism, generate revenue for the city, state and federal government as well as the investors and provide the homeowner with an opportunity to stay in his home for an affordable monthly payment and allow the residential housing market to stabilize over the next 5 years.

7. What's in it for the homeowner?

**ANSWER:** The homeowner, while losing his home to condemnation, doesn't have to move, can continue living at a more affordable cost and has 5 years within which to repurchase his home. The price will probably be higher than
the day it was condemned (at least that's the hope) but the homeowner may have an opportunity to recover some of his/her lost equity at some point in the future. There's one additional ancillary benefit for the homeowner. If the property is taken by condemnation (as opposed to foreclosure) it should not adversely affect the homeowner's FICO score (credit score) because there's no foreclosure on his credit report; just a condemnation loss not caused or created by him the borrower.

8. So (i) where do the cash flows go and (ii) who is going to administer this nightmare?

**ANSWER:**

(i) Let's assume we've got a lease payment based on a hypothetical new value of $258,000. The new lease payment would be based on a 40-year amortization of a $258,000 loan at an interest rate of 6% (monthly payment is $1,419.55). Assume further that the property tax rate is 1.25% of the property's value ($268.65) and insurance is equal to $100/month. Here's how it would look:

**SOURCES:** Rent from Borrower totals $1,788.20

**USES:**

a. Remitted to the Municipality for taxes and insurance and costs of initial implementation: $368.65
b. Retained Servicing Fee for Servicer (50 bps): $129.00
c. Pass-Thru to State for Bond Issuance Guaranty (50 bps): $129.00
d. Pass-Thru to Federal Government for Guaranty Fee (50 bps): $129.00
e. Pass-Thru Principal and Interest to Bondholder (at 4%): $1032.55

(ii) The best party equipped to handle all of this paper work and bookkeeping is the existing mortgage servicer since they can order the appraisals, work with the borrowers, remit monthly payments, handle lease execution, exercise of purchase options and eviction if necessary. They are already doing very similar work now in dealing with the existing defaulted mortgages and can continue more efficiently than anyone else.

9. What happens at the end of 5 years? What happens if the borrower defaults while he's a tenant?

**ANSWER:** The borrower/tenant can exercise the option to purchase any time during the 5-year period. If the property value increases (hopefully once property values stabilize), the increase in value would be split 50-50 between the bondholders and the Municipality. That will encourage everyone to stay in the deal and work to keep property values stable and increasing.
10. What’s supposed to happen to the existing MBS holders?

**ANSWER:** They will be forced to stop the practice of “extend and pretend” and will be forced to recognize their unrealized losses in the MBS they’ve been holding for the last 3-5 years everyone knows are clearly “underwater”. To induce the MBS holder to accept the “forced loss” on its MBS, the Federal Reserve (in concert with the Comptroller of the Currency) could revive a tool used during the Savings and Loan crisis in the mid-1980s; regulatory accounting procedures (or “RAP” accounting).

Under RAP accounting, the financial regulators would permit the MBS holder who suffers a loss to amortize its actual loss over a 5-7 year accounting period, i.e., amortizing 1/5 (or 1/7) of the loss each year until the loss has been recognized. In the interim, if the homes increase in value, they may still be able to recover some upside (see the next paragraph). In most cases this favorable regulatory accounting treatment could actually prevent financial institutions from collapsing and subject to seizure.

Interestingly, it is these existing MBS holders who are the best candidates to swap their existing underwater MBS for the newly-issued State, federally guaranteed mortgage revenue bonds because: (a) they still retain the possibility of recovering some of their previously-recognized loss if the property values increase and the borrower exercises his repurchase option within the 5 year lease term, i.e., they would receive 50% of the increased value as an “equity kicker”; (b) the bonds, as federally insured instruments, should qualify as part of Tier 1 Capital for regulatory capital purposes for financial institutions; (c) some of their gains from bond revenue and future income may not be taxable under “loss carry forward” accounting rules and may offset part of the loss recognized when the property was condemned, and (d) the Mortgage Revenue Bonds, as a 5-year, federally guaranteed instrument yielding almost 350 bps higher than a comparable 5-year US Treasury Note, make it an attractive short term investment.

11. Who’s going to decide how much the property is worth when the Municipality condemns it?

**ANSWER:** Allow the current servicer order at least 2 appraisals and have them forwarded to the City Attorney’s office or its designee to handle the valuation.

**Conclusion**

While there is no perfect solution, eminent domain is a step in the right direction, a step that better serves the public need for a public purpose. Some professional economists have suggested that the average LTV in certain California communities is 167% and the average unemployment rate is 25%. The problem is not unique to California. Other states and cities are confronted with this issue and the list keeps...
growing every day. The Wall Street Journal reports that while housing prices seem to have stabilized, there hasn’t been an increase in owner occupancy. That means that private investor groups are going to profit from the purchase of a massive number of homes and rent them out themselves.

Private investment in residential housing is a good first step but it can’t solve the long term housing crisis and the bankruptcy problem confronting more and more of our cities on a daily basis. At some point in the very near future, the mortgage servicers, who are advancing property taxes and insurance premiums for delinquent homeowners utilizing their lines of credit, are going to run out of credit facilities themselves. Mortgage servicer’s “accounts receivable” financial resources, even if 100% of their advances are reimbursed on liquidation of the property, aren’t infinite. That would leave private investors to buy delinquent tax liens at a discount to earn a 12% return on a “super lien” in order to preserve cash flow for our cities.

When the Federal Reserve permitted private banks and investment banks to implement the “pretend and extend” policy on its “mark to market” rules, it not only extended the housing crisis, it exacerbated it. The judicious use of eminent domain, when properly structured, can and will

1. relieve the financial stress on the housing market,
2. generate property tax revenues for municipalities while reducing the costs of managing blight,
3. generate income to the State by way of guaranty fees while mitigating the losses incurred in losing its tax base as its citizens relocate,
4. generate income for the Federal government for its guaranty and may reduce the costs to taxpayers of another bail out,
5. encourage homeowners not to abandon their homes because the payments are more affordable and to maintain them because of the possibility of recovering some of their lost “equity” if the market returns,
6. provide upside to municipalities and investors by providing them with an “equity kicker” opportunity if the tenant exercises the purchase option at a time when home prices had bottomed out and are beginning to rise,
7. provide an opportunity for existing investors to trade an underwater, uninsured asset for a federally insured, state issued, piece of short term paper yielding 3.50% more than a comparable US Treasury Note with the possibility of recovering some of the loss recognized when the unrealized losses were recognized, and
8. would provide a realistic alternative by which Wall Street can craft a financially viable solution to a problem it was instrumental in creating.

That sounds like a good trade-off when viewed in light of existing proposals being considered today. Desperate times call for desperate measures. Time is quickly running out for us to implement an “out of the box” solution. That time is now.
